EXPLANATION OF FORMAT

The period covered by this issue of the bibliography corresponds to the same months of *Index Medicus*. The journal coverage is limited to journals covered by *Index Medicus*, but the *Endocrinology Index* contains additional subject headings that are not included in *Index Medicus*. The *Endocrinology Index* is arranged in seven sections: 1) Table of Contents; 2) Subject Section; 3) Review Section; 4) Method Section; 5) Author Section; 6) Subject Index; and 7) Author Index.

Subject Section

The Subject Section is for the reader interested in recent literature related to certain broad topics and is divided into eight categories (pituitary, thyroid, etc.). The endocrine pancreas has not been included since it is the subject of another recurring bibliography, *Diabetes Literature Index*. Each category has a preconceived hierarchical organization of subject headings. A particular citation may appear more than once if it deals with multiple topics. Each citation to an article contains the full title, first author, and journal reference. If the article is written in a foreign language, the language is indicated. If the citation is to a review article, the number of references is given.

Author Section

The Author Section provides the reader with a list of keywords or index terms assigned to each citation. Each article appears only once. The citations are arranged alphabetically according to first author and are

numbered consecutively. These numbers are then used in the Author and Subject Indexes to enable the reader to identify references with ease. The complete citation (including index terms) are found but only the first three authors are listed. Foreign titles appear in the original language; these titles have been translated into English in the Subject Section. Following each citation are index terms which have been assigned to describe the contents of the article. Index terms appear in capital letters; some of these are accompanied by subheadings which appear in lower case letters. Asterisks (*) identify the index terms under which articles appear in *Index Medicus*.

Subject Index

All of the index terms assigned to the citations appearing in the bibliography are listed, followed by citation numbers which correspond to the numbers in the Author Section. The Subject Index is included for the convenience of the reader who wishes to select articles falling in categories of his own conception. For example, one who is interested in protein binding of a particular hormone could quickly find whether there were any articles dealing with this subject by determining if there were any citation numbers common to the two headings "protein binding" and the name of the specific hormone.

Author Index

The names of all authors are listed, followed by citation numbers which correspond to the numbers in the Author Section.

DISTRIBUTION

This publication is available free to National Institutes of Health grantees and contractors working in the field of endocrinology and libraries of medical schools. Requests from these qualified individuals to receive free copies of this publication must include their grant or contract number and the title of their project. These requests as well as address changes and other communications should be addressed to:

Scientific Communications Office
Endocrinology Index
National Institute of Arthritis and Metabolic Diseases
National Institutes of Health
Bethesda, Maryland 20014

Other individuals and libraries may receive this publication by subscribing *directly* to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. One year's subscription includes 6 bimonthly issues. Subscription price per year in the United States, Canada, and Mexico, \$16.00; foreign, \$4.00 additional; and \$2.75 for a single copy. Payment is required in advance, and check or money order should be made payable to the Superintendent of Documents.

Use of funds for printing this publication
approved by the Director of the Bureau of
the Budget on October 7, 1968.

ACKNOWLEDGMENT

The *Endocrinology Index* was compiled with the cooperation and assistance of the staff of the National Library of Medicine. The citations were processed by the Library's computer-based Medical Literature Analysis and Retrieval System (MEDLARS).

PREFACE

The *Endocrinology Index* is a bimonthly publication of the National Institute of Arthritis and Metabolic Diseases. This selected bibliography which is produced from the National Library of Medicine's Medical Literature Analysis and Retrieval System (MEDLARS), has been initiated to supply those scientists working in the field of endocrinology with a much needed current awareness tool and is intended to help facilitate greater integration of research and clinical efforts in this field.

Demonstration and effect of melatonin in fish.

Gen Comp Endocr 14(1):86-97, 1970

"Melatonin (N-acetyl-5-methoxytryptamine) was identified in the pineal organ of the Pacific salmon Oncorhynchus tshawytscha ...The store of pineal melatonin in immature salmon was approximately six times as great as that present in mature salmon...Intraperitoneal injections of melatonin (20 mg/fish for 50 days) into goldfish inhibited the increase in gonad size which accompanied increased daily light exposure in those animals which received placebo injections...Melatonin, produced or stored specifically within the pineal organ, appears to exert an inhibitory effect upon gonad functions, possibly by inhibiting the release of a gonadotropic factor."

Hyyppä N, Valavaara M (Dept. of Anatomy, Univ. of Turku, Turku 3, Finland)

The effect of castration and hypophysectomy on the content of noradrenaline and serotonin in the hypothalamus of the rat.

Experientia 26(2):193-194, 1970

(1) "No significant effect of castration was seen on the content of NA and 5-HT in the anterior or posterior hypothalamus (nor) in the cerebral cortex of male rats; (2) The hypophysectomy of long duration (3 months) caused a significant increase of the content of NA in the anterior and posterior hypothalamus of female rats, but it had no effect on the NA content in the cerebral cortex. Also the amount of 5-HT increased almost significantly in the posterior hypothalamus."

Kamberi IA, Dobayashi Y (Kobayashi: Worcester Foundation for Experimental Biology, Shrewsbury, Mass. 01545)

Monoamine oxidase activity in the hypothalamus and various other brain areas and in some endocrine glands of the rat during the estrus cycle.

J Neurochem 17(2):261-268, 1970

"Activity of MAO changed cyclically in the hypothalamus, amygdala, adrenals and ovaries...During the estrus cycle much lower levels of activity of MAO were demonstrated in other regions of the brain (frontal and lateral cerebral cortex), in the pituitary and in the uterus, none of which showed cyclical changes."

Kurachi K, Hirota K (Dept. of Obstetrics and Gynecology, Osaka Univ. Medical School, Osaka, Japan)

Catecholamine metabolism in rat's brain related with sexual cycle.

Endocr Jap Suppl 1:69-73, 1969

Partial results found were: significant change in diencephalon NA content in the following endocrinological conditions: (a) sexual cycle; (b) oophorectomy; (c) administration of estrogen after oophorectomy. It was concluded from experimental results "that the hypothalamic catecholamine may play an important role in gonadotropin secretion control."

Systemic administration of dopamine to rats causes an interruption of LH. This result can be related to the fact that monoaminergic neurons of the ventral tuber show hyperactivity in guinea pigs during the pre-ovulatory period in the course of which the gonadotropic functions are stimulated.

Segal DS, Whalen RE (Whalen: Dept. of Psychobiology, Univ. of California, Irvine, Calif. 92664)

Effect of chronic administration of p-chlorophenylalanine on sexual receptivity of the female rat.

Psychopharmacologia (Berlin) 16(5):434-438, 1970

"It has been postulated that in the female rat sexual receptivity is inhibited by serotonin. This hypothesis was examined by comparing the effects of estrogen and progesterone with the effects of estrogen plus pCPA, a depletor of brain serotonin, on the induction of sexual receptivity. Progesterone was found to facilitate the effects of estrogen on the induction of receptivity. pCPA which induced low levels of brain serotonin did not facilitate estrogen induced receptivity. It was concluded that no direct relationship exists between brain serotonin and receptivity."

Luteinizing hormone-releasing factor discharged by dopamine in rats.

J Endocr 46(3):401-402, 1970

"The data presented indicate the existence of a dopaminergic transmission for the LRF secretory neurons."

Yano S, Kumagai A, Yamamura Y (Third Dept. of Internal Medicine, Osaka Univ. Hospital, Osaka, Japan)

Changes of oxytocin contents in the neurohypophysis of rats after norepinephrine treatment.

Endocr Jap Suppl 1:93-97, 1969

Partial results indicate that after NE treatment, the neurohypophysis oxytocin content was "found to decrease to about 70% of control value at 30 min. after treatment, and the repletion of oxytocin in the lobes was found in 180 min. after treatment."
